

How We Learned to Start Cooking High Quality Bitumen and Love the ML in Petrochemical Industry

zyfra.com

Zyfra is all about Industry 4.0 in manufacturing...

Getting legacy machines IIoT ready, increasing OEE 15 – 20% in the process through own devices and software solutions

Oil & Gas, Chemical Production...

Increasing debit of oil wells by 1,5% -2% through pump and watering control

And Metallurgy

Decreasing steel pipes production defects from 3% to 0.4%

But today we are cooking Bitumen

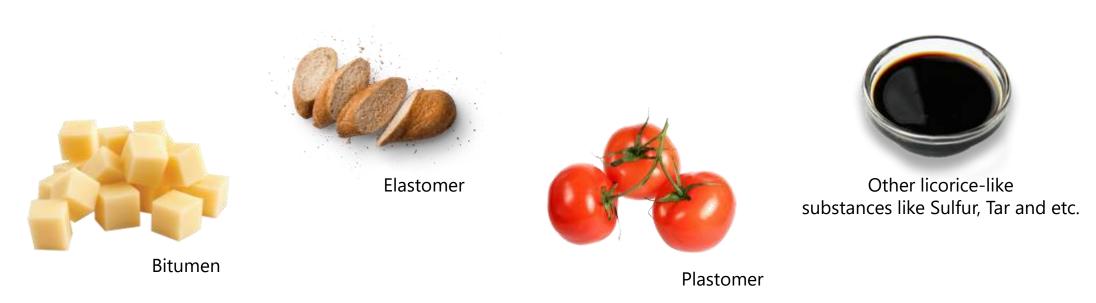

- Bitumen low-grade of crude oil
- 90% of bitumen goes to road construction, 8% to waterproofing products like roofing felt and sealing flat roofs
- Polymer Modified Bitumen (PmB) is at the core of modern road construction
- Road maintenance costs reduced by 60%
- Overhaul life is growing from 3-4 years to 7-10 years

Secrets of Gluten-Free 100% Vegan Zero-Lactose Bitumen Formula

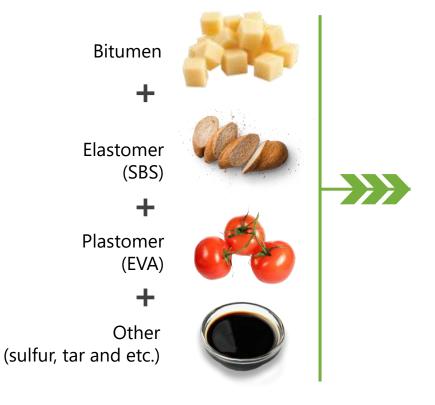

Don't Try That at Home

Like different spices create different flavors, varying proportions of the batch components result in different product properties

Secrets of Gluten-Free 100% Vegan Zero-Lactose Bitumen Formula

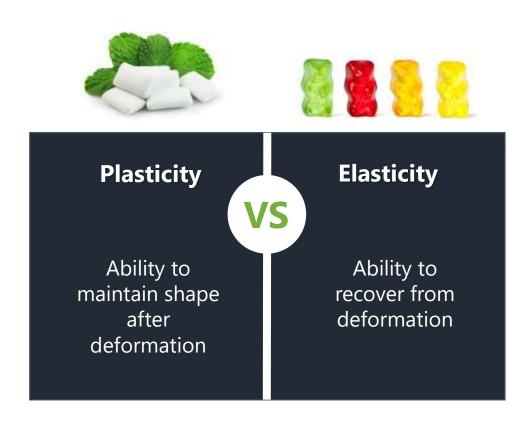

By varying the proportions of the batch components, we can obtain the required product characteristics

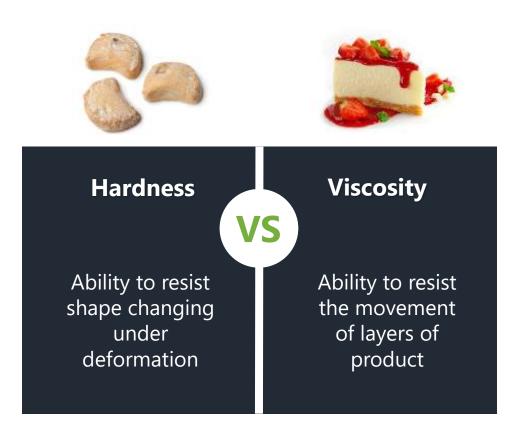

How would you like it done? (Not rare)

Mixing and Spicing

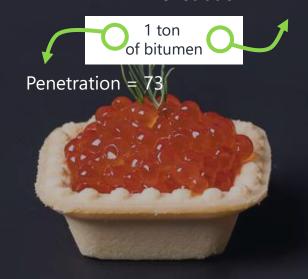

GOAL: Reduce

Reduce cost of the product (% of additives) with respect to quality requirements

PROBLEM:

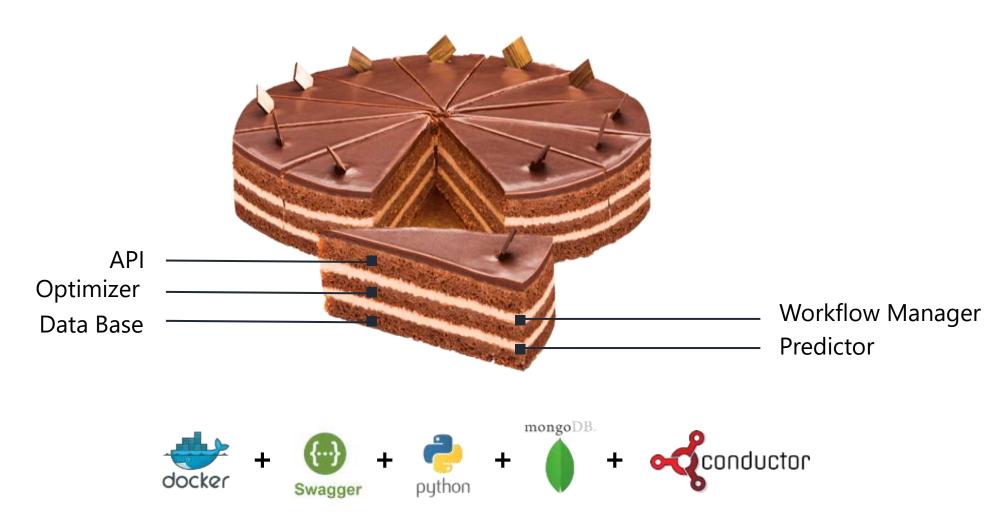

High variability in the characteristics of the feedstock (especially bitumen) due to its organic nature

Penetration = 77

Zyfra Microservice Cooking Machine Architecture

Final recipe. Or is it?

Algorithm

- 1. Define the starting recipe to build the search grid with. There may be several
- 2. Build 10 new recipes around each of the starting recipe
 - 3. Send all new recipes from p.2 to Predictor for getting quality estimation
- 4. Select top 10% best recipes based on target function

p.2-4 are executed iteratively until the optimal value of target function is found or the searching procedure gets to iterations limit

Predictor

A la carte

Predictor – service for getting predictions of PmB characteristics based on proportion of components in recipe and characteristics of feedstock

1147 batches of PMB

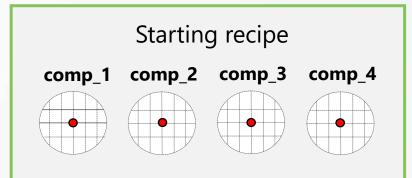

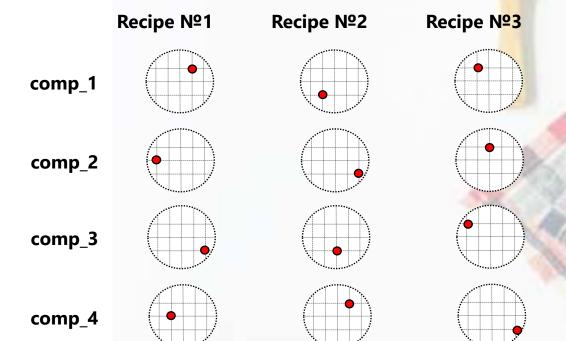

3 targets – Penetration 25°, Penetration 0°, Softening point

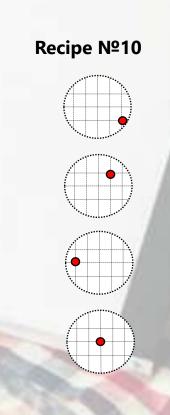

Models – Random Forest, Ridge

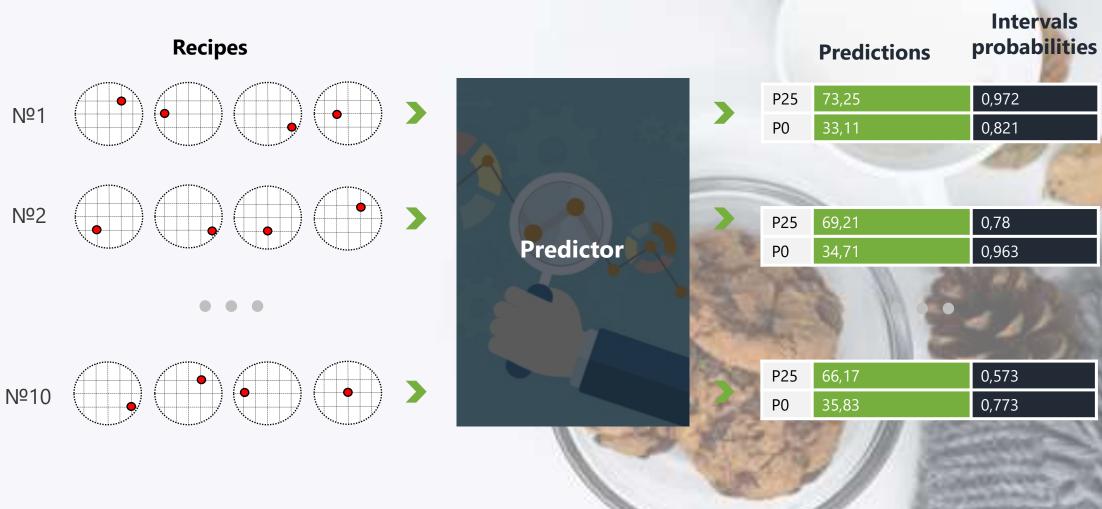

Optimizer – The real ML cookbook

Optimizer

Cooking Bitumen is not art. It's math!

Target function

 $Q = \sum_{i} price(comp_i) \cdot mass(comp_i) + Z \cdot max(P(feat_i < limFeat_i))$

- Z balancing coefficient between cost and risk
- $P(feat_i < limFeat_i)$ probability of not getting into interval for i-th PMB characteristic
- $price(comp_i)$ price of i-th component
- $mass(comp_i)$ mass of i-th component

Results 1: Ok Bitumen is still 30% art

Production engineers at bitumen plants are relying on our recommendations

70%

of the time

100%

of them are getting into the intervals of PMB characteristics

Results 2: PMB production costs decreased by 3.5%

This means our client can afford around

95 000

pizzas each year

Or Italy could build additional

300 km

of highway class roads each year. With the spare Bitumen

I would go for pizza!

Or you could cover roofs of

18%

of houses in Barcelona with fresh waterproof elastic Bitumen

Results 3: I get cookies

- 1. The customer only pays for savings, the project was made on a "success fee" contract.
- 2. So every time you hop on a driveway I get a small cookie.
